

A little room to figure it out.

Keep the question. Make room for your thinking.

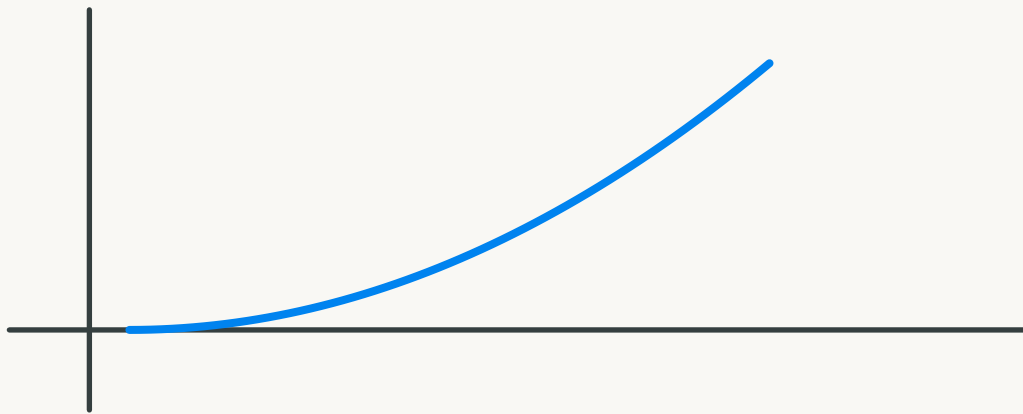

01 / THE QUESTION

PRACTICE PROMPT · SAMPLE CONTENT

A curve, a tangent, a little working space.

For $y = x^2$, find the tangent at $x = 2$.

Sketch your reasoning before checking the result.

A fresh attempt is one duplicate away.

02 / MY WORKING

$$y = x^2$$

$$dy/dx = 2x \rightarrow \text{slope} = 4$$

$$y - 4 = 4(x - 2)$$

$$\underline{y = 4x - 4}$$
